this book highlights the latest achievements concerning the theory methods and practice of fault diagnostics fault tolerant systems and cyber safety when considering the diagnostics of industrial processes and systems increasingly important safety issues cannot be ignored in this context diagnostics plays a crucial role as a primary measure of the improvement of the overall system safety integrity level obtaining the desired diagnostic coverage or providing an appropriate level of inviolability of the integrity of a system is now practically inconceivable without the use of fault detection and isolation methods given the breadth and depth of its coverage the book will be of interest to researchers faced with the challenge of designing technical and medical diagnosis systems as well as junior researchers and students in the fields of automatic control robotics computer science and artificial intelligence

this book enables readers to understand system identification and linear system modeling through 100 practical exercises without requiring complex theoretical knowledge the contents encompass state of the art system identification methods with both time and frequency domain system identification methods covered including the pros and cons of each each chapter features matlab exercises discussions of the exercises accompanying matlab downloads and larger projects that serve as potential assignments in this learn by doing resource

this book presents an overview of the different errors in variables eiv methods that can be used for system identification readers will explore the properties of an eiv problem such problems play an important role when the purpose is the determination of the physical laws that describe the process rather than the prediction or control of its future behaviour eiv problems typically occur when the purpose of the modelling is to get physical insight into a process identifiability of the model parameters for eiv problems is a non trivial issue and sufficient conditions for identifiability are given the author covers various modelling aspects which taken together can find a solution including the characterization of noise properties extension to multivariable systems and continuous time models the book finds solutions that are constituted of methods that are compatible with a set of noisy data which traditional approaches to solutions such as total least squares do not find a number of identification methods for the eiv problem are presented each method is accompanied with a detailed analysis based on statistical theory and the relationship between the different methods is explained a multitude of methods are covered including instrumental variables methods methods based on bias compensation covariance matching methods and prediction error and maximum likelihood methods the book shows how many of the methods can be applied in either the time or the

frequency domain and provides special methods adapted to the case of periodic excitation it concludes with a chapter specifically devoted to practical aspects and user perspectives that will facilitate the transfer of the theoretical material to application in real systems errors in variables methods in system identification gives readers the possibility of recovering true system dynamics from noisy measurements while solving over determined systems of equations making it suitable for statisticians and mathematicians alike the book also acts as a reference for researchers and computer engineers because of its detailed exploration of eiv problems

this publication presents a series of practical applications of different soft computing techniques to real world problems showing the enormous potential of these techniques in solving problems provided by publisher

the symposium covered three major areas adaptive control identification and signal processing in all three new developments were discussed covering both theoretical and applications research within the subject area of adaptive control the discussion centred around the challenges of robust control design to unmodelled dynamics robust parameter estimation and enhanced performance from the estimator while the papers on identification took the theme of it being a bridge between adaptive control and signal processing the final area looked at two aspects of signal processing recursive estimation and adaptive filters

contains research articles on linear algebra with emphasis on applications and numerical procedures these applications include such areas as markov chains networks signal processing systems and control theory mathematical programming economic and biological modeling and statistics and operations research
